Vitelize Health

CLINICAL BRIEFING FOR GYM OPERATORS

GLP-1 therapy has a muscle problem.

Why the next phase of obesity care belongs in the gym.

Vitelize Health · vitelizehealth.com

Up to 39% of weight lost can be lean mass.

In the STEP 1 body composition substudy, lean mass made up as much as 39% of total weight lost on GLP-1 therapy alone.

> Wilding et al., N Engl J Med 2021

Stopping brings most of it back.

One year after treatment ended in the STEP 1 extension, participants had regained two-thirds of the weight they lost.

> Wilding et al., Diabetes Obes Metab 2022

Medication plus exercise beats either alone.

After an initial diet, GLP-1 therapy combined with structured exercise cut body-fat percentage about twice as much as either treatment on its own over one year.

> Lundgren et al., N Engl J Med 2021

The open question is muscle.

LEAN-PREP, a randomised trial at Dasman Diabetes Institute, is testing resistance exercise and protein in 232 adults starting GLP-1 therapy.

> Alawadhi et al., BMJ Open 2026

OUR SCIENTIFIC ADVISOR

Prof. Stuart Gray

Professor of Muscle and Metabolic Health, University of Glasgow

- Research: sarcopenia, resistance exercise and nutrition
- Investigator on the LEAN-PREP trial

OUR MEDICAL DIRECTOR

Dr. Micah Craig, MD

Board certified in Internal Medicine, Master's in Biochemistry

- Sets our prescribing standards
- Owns the lab schedule and monitoring protocols

The model: the clinic inside the gym.

- Physician-supervised GLP-1 therapy, labs at every consult
- Training with the gym's own coaches
- Custom meal plan and protein
- Body composition tracking
- Vitelize funds the advertising that brings new patients in

THE EVIDENCE, IN ONE LIST

1. GLP-1 therapy alone can cost lean mass.
2. Stopping brings most of the weight back.
3. Medication plus exercise outperforms either.
4. Resistance training and protein are the variables to get right.
5. Gyms already deliver the training.
